Mobile broadband speeds will vary and are dependent on a range of factors including network configuration, network capacity, signal strength, and the conditions of your mobile broadband subscription. Maximum wireless signal rate derived from IEEE Standard 802.11 specifications. Actual data throughput will vary. Network conditions and environmental factors, including volume of network traffic, building materials and construction, lower cloud data throughput rate. Environmental factors will adversely affect wireless signal range. *Factors including the number of connected devices and strength of mobile network signal may affect battery life.
