

Impact Multilingual User Interface Implementation

Revision E

Multilingual User Interface (MUI)

This document describes how to use the Windows® Multilingual User Interface on the Datalogic M-Series Processor. The Microsoft® Windows user interface can be displayed in a variety of languages using the MUI.

Datalogic optionally provides several MUI languages already installed. The MUI provides nearly the same level of language support as the localized version of the operating system, with a few minor exceptions. Visit the Microsoft web site (www.microsoft.com) for more details.

There are several levels of human language support in Impact software. First, the custom end-user interfaces (Control Panels in Impact CPM) use Unicode UTF-8 encoding. This means that user interfaces for the factory floor are created in the most appropriate language for the users at the factory. The default human language in the Impact software editing environment, VPM, CPM, etc., is English but it has been translated into Chinese Simplified and other languages. All of the documentation is available in English only.

The M-Series Vision Processor is optionally shipped with the following nine languages installed:

- English
- Chinese Simplified
- Chinese Traditional
- French
- German
- Italian
- Japanese
- Korean
- Spanish

To choose a new user interface language

1. Click Start and choose Control Panel.
2. In the Control Panel, open the icon labeled Date, Time, Language, and Regional options.
3. Open Regional and Language Options.
4. In the Regional and Language Options dialog, click the Languages tab.
5. In the Language tab, there is a drop down list of the available languages. Select the desired language from the list.
6. Click OK to close all the dialogs.
7. Log Off and Log On Windows for the new language to be displayed.
